ESP32 Slimme meter interface / sturing

Dit project is opgebouwd uit 4 onderdelen

Interface

Deze leest de data uit de P1 poort van de slimme meter in en maakt deze beschikbaar voor verdere verwerking.

Er zijn verschillende interface modules beschikbaar.

Alvorens verder te gaan over deze interfaces, van elk interface zijn er 2 versies beschikbaar. Eentje eindigend op STA en een ander eindigend op AP.

Dit heeft betrekking op de manier waarop er verbinding kan gemaakt worden met de interface.

De STA interface module. (bestandsnaam eindigt op _STA.ino)

Hierbij is de ESP32 ingesteld in **Station Mode**. Dit wil zeggen de gegevens van de interface beschikbaar zijn via je eigen WiFi netwerk.

De AP interface module. (bestandsnaam eindigt op _AP.ino)

Hierbij is de ESP32 ingesteld in de **Access Point Mode**. De ESP32 heeft zijn eigen netwerk namelijk **ESP32Energie**

Soorten interface modules.

Slimme_meter_web_STA en Slimme_meter_web_AP.

Dit is de meest eenvoudige uitvoering.

Leest de gegevens van de P1 poort en stuurt deze naar een webpagina.

Vooral nuttig om op een eenvoudige manier je verbruik op te volgen en om op een effectieve manier het sluikverbruik op te sporen.

Beschikbare gegevens:

Totaal elektriciteitsverbruik

Totaal injectie

Verbruik nu

Injectie nu

Totaal gas in m3

Slimme_meter_esp32_STA en Slimme_meter_esp32_AP.

Deze is vooral nuttig als je zelf elektriciteit opwekt

Leest de gegevens van de P1 poort en stuurt deze naar een webpagina.

Beschikbare gegevens:

Totaal elektriciteitsverbruik

Totaal injectie

Verbruik nu

Injectie nu

Totaal gas in m³

Deze gegevens kan je eveneens doorsturen naar een display module (zie meer hierover verder in de handleiding).

3 relaisuitgangen om (huishoud)toestellen te sturen in functie van beschikbaar zelf opgewekt vermogen of op tijdsbasis.

Een PWM uitgang om bvb een elektrische boiler op te warmen in functie van zelf opgewekt vermogen zonder gebruik te moeten maken van aangekocht vermogen.

Overige modules.

Display

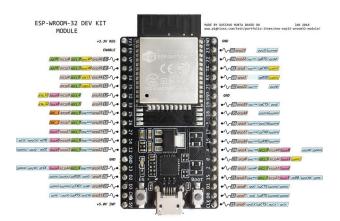

een apart LCD scherm waarop je kan zien wat het verbruik is of bij zonnepanelen wat de injectie op het net is. Bij gebruik van de digitale of PWM module of relais kan je ook zien wat de huidige sturing is.

Digitale uitgangsmodule

Sturen van bijvoorbeeld een wasmachine als er genoeg zonne-energie is, of bij minder goede dagen starten op een bepaald uur.

PWM module

Voor gebruik bij een elektrische warm water boiler. Stuurt het niet gebruikt opgewekt vermogen naar de boiler, dit zonder gebruik te maken van vermogen dat van het net gehaald wordt. Kan ook op tijd gestuurd worden om ook bij slechte dagen warm water te hebben.

Meer info over de slimme meter vind je hier https://jensd.be/1205/linux/data-lezen-van-de-belgische-digitale-meter-met-de-p1-poort

https://www.netbeheernederland.nl/ upload/Files/Slimme meter 15 a727fce1f1.pdf

 $\underline{https://www.fluvius.be/sites/fluvius/files/2020-02/technische-info-displays-digitale-elektriciteitsmeter.pdf}$

De ESP32 wordt geprogrammeerd met de Arduino IDE hoe je deze en de benodigde ESP32 software op je PC moet installeren vind je hier https://randomnerdtutorials.com/installing-the-esp32-board-in-arduino-ide-windows-instructions/

Meer info over ESP32 en nog veel meer https://randomnerdtutorials.com/projects-esp32/

De p1 poort gratis activeren doe je via Fluvius

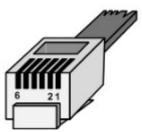

https://www.fluvius.be/nl/thema/meters-en-meterstanden/digitale-meter/maak-je-meter-slim#hoe-activeer-of-deactiveer-ik-de-gebruikerspoorten-van-mijn-digitale-meter/

github pagina voor dit project https://github.com/thieu-b55/Slimme-Digitale-Energie-Meter

De RJ12 connector

Foto's gecopiëerd uit https://www.netbeheernederland.nl/_upload/Files/Slimme_meter_15_a727fce1f1.pdf

Pin#	Signal name	Description	Remark
1	+5V	+5V power supply	Power supply line
2	Data Request	Data Request	Input
3	Data GND	Data ground	
4	n.c.	Not connected	
5	Data	Data line	Output. Open collector
6	Power GND	Power ground	Power supply line

Interface modules

Slimme meter web STA en Slimme meter web AP.

De meest eenvoudige module. Leest de gegevens van de P1 poort en stuurt die door naar een webpagina.

Onderdelen

1 x kabeltje met RJ12 plug 1x ESP32WROOM Devkit

1 x Led

1x BC547

1x R 1K

1x R 10K

1 x R 2K2

1 x R 20K

1x 4700 uF / 16 Volt

1x 2200 uF / 16 Volt

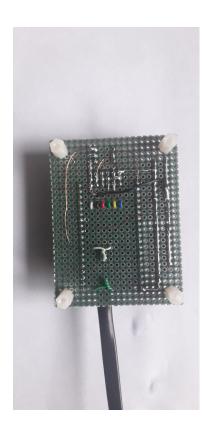

(eventueel een aparte 5 Volt voeding zie beschrijving)

Alvorens de P1 poort op de meter te kunnen gebruiken, moet deze eerst geactiveerd worden. Voor België moet dit gebeuren via Fluvius.

https://www.fluvius.be/nl/thema/meters-en-meterstanden/digitale-meter/maak-je-meter-slim#hoe-activeer-of-deactiveer-ik-de-gebruikerspoorten-van-mijn-digitale-meter/

Volgens de beschrijving kan deze P1 poort 5 Volt 250 mA leveren. Dit is niet genoeg voor de ESP32 module om data te kunnen doorsturen. 2 capaciteiten kunnen dit probleem verhelpen. Enige nadeel is dat na het inpluggen of een eventuele (zeldzame) spanningsuitval de ESP32 module manueel moet gereset worden. Een externe 5 Volt voeding gebruiken kan ook , de 2 capaciteiten zijn dan niet nodig.

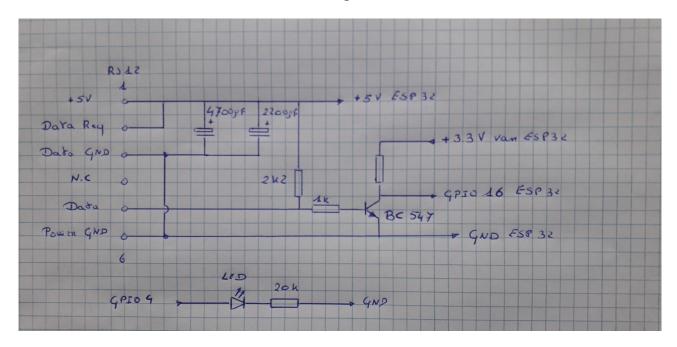

Maak de nodige verbindingen zoals op het schema hieronder.

RJ12 is de verbinding met de P1 poort.

Een ESP32 Devkit heeft meerdere GND aansluitingen. Best is die allemaal aan te sluiten.

Laad nu het programma

Slimme_meter_web_STA.ino gegevens bereikbaar via je WiFi netwerk

Slimme_meter_web_AP.ino gegevens bereikbaar via ESP32Energie netwerk

met de Arduino IDE in de ESP32.

Plug de module in de geactiveerde P1 poort, voor de uitvoering met condensators zonder de externe 5V voeding, druk op de ESP32Devkit resetknop (links onder).

Slimme_meter_web_STA.ino

Na het opstarten is er een nieuw netwerk beschikbaar, ESP32energie maak verbinding met dit netwerk

netwerk: ESP32Energie paswoord: ESP32pswd

ga naar pagina 192.168.4.1

20:51 🗷	(C) THE	🌘 🗐 🛗 ill 80% 🛍

ssid:					
pswd :					
	Bevestig				

Vul de gevraagde gegevens in.

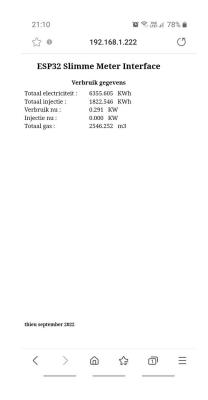

ssid >> naam van jpuw WiFi netwerk

pswd >> paswoord van jouw WiFi netwerk

Druk op bevestig.

De ESP32 herstart automatisch. Indien alle WiFi gegevens correct zijn ingevuld zal de ESP32 zich verbinden met jouw WiFi netwerk. Netwerk ESP32Energie is niet meer beschikbaar.

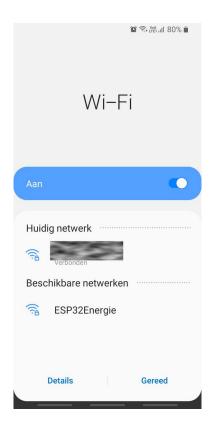

Ga naar pagina 192.168.1.222 van je eigen netwerk om je verbruiksgegevens te raadplegen. Pagina herlaadt automatisch elke 15 seconden.

Slimme_meter_web_AP.ino

Na het opstarten is er een nieuw netwerk beschikbaar, namelijk ESP32energie maak verbinding met dit netwerk

netwerk: ESP32Energie paswoord: ESP32pswd

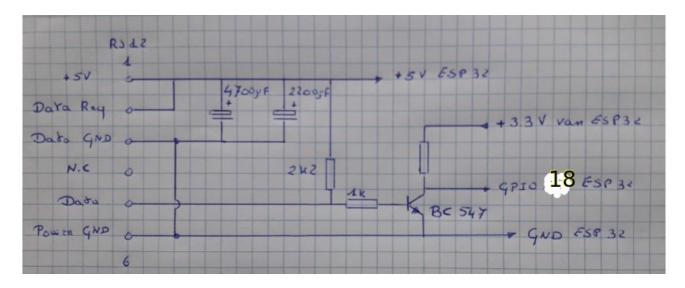

Ga naar pagina 192.168.4.1 om je verbruiksgegevens te raadplegen. Pagina herlaadt automatisch elke 15 seconden.

Slimme_meter_esp32_STA en Slimme_meter_esp32_AP.

Aansluitingen DS3231 RTC

SDA naar GPIO21 SCL naar GPIO22 GND naar GND ESP32 VCC naar 3.3V ESP32

Voor de aandachtige lezers. Ik had geen DS3231 RTC module en heb deze vervangen door een DS3231 IC. Als je dit doet vergeet dan de 2x 10K pull-up weerstanden van SDA / SCL naar de *3.3 Volt van de ESP32* module niet.

Een ESP32WROOM Devkit module heeft meerdere GND aansluitingen, voor een goede werking is het noodzakelijk om deze allemaal aan te sluiten.

Onderdelen

1 x kabeltje met RJ12 plug 1x ESP32WROOM Devkit

1x BC547

1X DS3231 RTC module

1x R 1K

1x R 10K

1 x R 2K2

1x 4700 uF / 16 Volt

1x 2200 uF / 16 Volt

(eventueel een aparte 5 Volt voeding zie beschrijving)

Wat kan je ermee doen.

Via een apart WiFi netwerk de verbruiksgegevens opvragen.

Zoeken wat het sluikverbruik is.

Zien wat elk toestel verbruikt.

Deze module is ook nodig om de verder beschreven modules te gebruiken.

Alvorens de P1 poort op de meter te kunnen gebruiken, moet deze eerst geactiveerd worden. Voor België moet dit gebeuren via Fluvius.

https://www.fluvius.be/nl/thema/meters-en-meterstanden/digitale-meter/maak-je-meter-slim#hoe-activeer-of-deactiveer-ik-de-gebruikerspoorten-van-mijn-digitale-meter/

Volgens de beschrijving kan deze P1 poort 5 Volt 250 mA leveren. Dit is niet genoeg voor de ESP32 module om data te kunnen doorsturen. 2 capaciteiten kunnen dit probleem verhelpen. Enige nadeel is dat na het inpluggen of een eventuele (zeldzame) spanningsuitval de ESP32 module manueel moet gereset worden. Een externe 5 Volt voeding gebruiken kan ook , de 2 capaciteiten zijn dan niet nodig.

Laad het programma

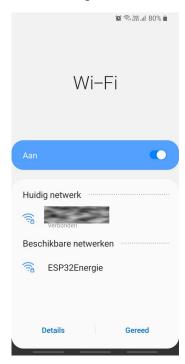

Slimme_meter_esp32_STA.ino bereikbaar via je WiFi netwerk of

Slimme_meter_esp32_AP.ino bereikbaar via het ESP32energie netwerk in de ESP32WROOM devkit met behulp van de Arduino IDE.

Slimme_meter_esp32_STA.ino

Na het opstarten is er een nieuw netwerk beschikbaar, ESP32energie maak verbinding met dit netwerk

netwerk: ESP32Energie paswoord: ESP32pswd

ssid >> naam van jouw WiFi netwerk pswd >> paswoord van jouw WiFi netwerk

Druk op bevestig.

De ESP32 herstart automatisch. Indien alle WiFi gegevens correct zijn ingevuld zal de ESP32 zich verbinden met jouw WiFi netwerk. Netwerk ESP32Energie is niet meer beschikbaar.

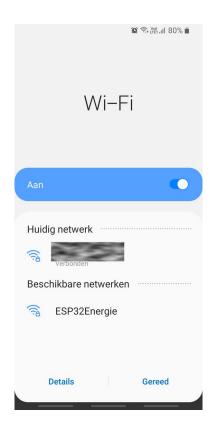

De webpagina is nu beschikbaar op 192.168.1.222 van je eigen WiFi netwerk. Voor de verdere gemeenschappelijke uitleg zie 2 bladzijden verder.

Slimme_meter_esp32_AP.ino

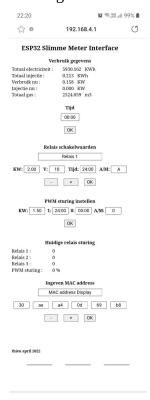

Na het opstarten is er een nieuw netwerk beschikbaar, ESP32energie maak verbinding met dit netwerk

netwerk: ESP32Energie paswoord: ESP32pswd

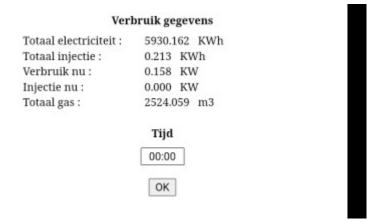

Ga naar pagina 192.168.4.1 van het ESP32energie netwerk

Het gedeelte dat we nu kunnen gebruiken is

Hierop kun je de verschillende meterstanden raadplegen en als je ook een digitale gasmeter hebt kan je deze ook aflezen.

Je kan er ook het sluipverbruik mee opsporen en dat is meer als men zou verwachten heb ik gemerkt.

Onder Tijd is er ook een klok, deze wordt bijgehouden door de DS3231 RTC module, als je alleen de interface gebruikt verder niet heel nuttig. Invullen doe je door op het veld te gaan staan, alles te wissen en dan in te vullen volgens het formaat *uu:mm* en daarna op OK te drukken.

Voor de andere velden op deze webpagina moet je extra modules installeren. De uitleg voor deze velden kan je terugvinden bij de desbetreffende modules.

Display module

Overige ESP32 ESP32WROOM Devkit aansluitingen

ESP32 5V naar externe 5V

ESP32 GND naar externe GND (alle GND's aansluiten)

Om de display module te kunnen gebruiken moeten we eerst het MAC adres van de hiervoor gebruikte ESP32 kennen.

Open de Arduino IDE en open de monitor op 115200 baud.

Programmeer ESP32WROOM Devkit met het programma

MAC_adres_esp32.ino (bladzijde 38)

Het MAC adres verschijnt in de terminal.

Maak verbinding met de interface module.

Indien je gekozen hebt voor de _STA versie, doe je dit via je WiFi netwerk webadres 192.168.1.222 Indien je gekozen hebt voor de _AP versie via het ESP32 eigen netwerk.

Wifi netwerk ESP32Energie Paswoord ESP32pswd

webadres 192.168.4.1

Dit gedeelte van de webpagina heb je nu nodig. Met behulp van de + en – toetsen kan je kiezen welk MAC adres je wil ingeven. In dit geval dat van het display. Vul het adres in in de zes voorziene vakjes en druk OK.

Opgelet 2 dezelfde MAC adressen invullen voor verschillende modules gaat niet. Indien je het in te geven adres al hebt ingevuld voor een andere module verander dit eerst.

Heel belangrijk na het veranderen van *een(1)* MAC adres is er een automatische herstart van de interface module.

In de library TFT_eSPI pas het bestand

User_Setup_Select.h

aan zoals hieronder.

Er mag maar 1 #include gekozen zijn.

```
User Setup Select.h x
             // This header file contains a list of user setup files and defines which one the
               // compiler uses when the IDE performs a Verify/Compile or Upload.
               // Users can create configurations for different Espressif boards and TFT displays.
               // This makes selecting between hardware setups easy by "uncommenting" one line
                 // The advantage of this hardware configuration method is that the examples provided
                 // with the library should work with different setups immediately without any other
                // changes being needed. It also improves the portability of users sketches to other
               // hardware configurations and compatible libraries.
 10
11
12
13
                // Create a shortcut to this file on your desktop to permit quick access for editing.

Laad het programma **slimme_meter_esp32_display.ino** met behulp van de Arduino IDE in de ESP32WROOM Devkit module.

De interface stuurt elke 10 seconden data naar de display. Na max 10 seconden zou je dit moeten krijgen.

Display bij injectie, het momenteel geïnjecteerd vermogen in het groen.

Display bij afname van het net vermogen in het rood.

De display toont tevens welk relais er is uitgestuurd of in geval van de PWM sturing het percentage van de uitsturing.

Digitale uitgangsmodule

Onderdelen

1x ESP32WROOM Devkit 1x hoog vermogen **5V relais**

https://nl.aliexpress.com/item/4000185959463.html?

spm=a2g0o.order list.0.0.43f479d2DHQrtK&gatewayAdapt=glo2nld

Relais zou volgens beschrijving 30A kunnen schakelen. Niet geprobeerd, maar aangezien een huishoudtoestel bij opstart slechts een laag vermogen verbruikt, is dat niet ook niet nodig. Getest op wasmachine en relais doet wat hij moet doen.

1x externe voeding 5V

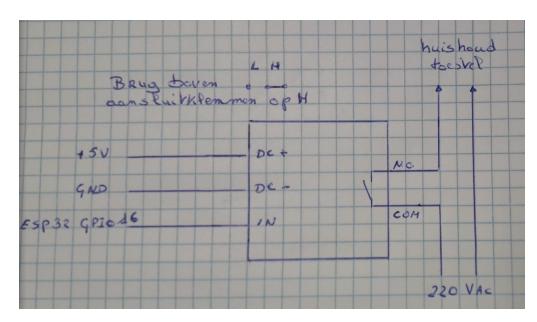

Hoe aansluiten

ESP32

ESP32 5V naar externe 5V

ESP32 GND naar externe GND (alle GND's aansluiten)

ESP32 GPIO16 zie schema hieronder

Om een digitale uitgangsmodule te kunnen gebruiken moeten we eerst het MAC adres van de hiervoor gebruikte ESP32 kennen.

Open de Arduino IDE en open de monitor op 115200 baud.

Programmeer ESP32 ESP32WROOM Devkit met het programma

MAC_adres_esp32.ino

Het MAC adres verschijnt in de terminal.

Maak verbinding met de interface module.

Indien je gekozen hebt voor de _STA versie, doe je dit via je WiFi netwerk webadres 192.168.1.222 Indien je gekozen hebt voor de _AP versie via het ESP32 eigen netwerk.

Wifi netwerk ESP32Energie Paswoord ESP32pswd

webadres 192.168.4.1

Dit gedeelte van de webpagina heb je nu nodig. Met behulp van de + en - toetsen kan je kiezen welk MAC adres je wil ingeven. In dit geval dat van een relais module 1, 2 of 3. Vul het adres in in de zes voorziene vakjes en druk OK.

Opgelet 2 dezelfde MAC adressen invullen voor verschillende modules gaat niet. Indien je het in te geven adres al hebt ingevuld voor een andere module verander dit eerst.

Heel belangrijk na het veranderen van *een(1)* MAC adres is er een automatische herstart van de interface module.

Laad het programma **esp32_relais.ino** met behulp van de Arduino IDE in de ESP32WROOM Devkit module.

Om de 3 x relais te kunnen instellen maken we gebruik van het volgende gedeelte van de webpagina

Met behulp van de + / – toetsen kies welke relaismodule je wilt instellen en druk op OK Nu zijn er verschillende velden die je kan instellen.

Het gemakkelijkste eerst

Automatisch / Manueel

mogelijkheden

0 relais uitgeschakeld1 relais altijd gestuurd

A relais wordt gestuurd in functie van de vorige velden.

KW vul hier het vermogen in dat geïnjecteerd wordt op het net alvorens de relais mag opkomen Als je niet wil dat een toestel ingeschakeld wordt op geïnjecteerd vermogen vul dan hier een waarde in die hoger ligt dan wat de zonnepanelen kunnen leveren.

V vertraging in minuten na het bereiken van in KW ingevuld vermogen alvorens relais mag

opkomen. Niet echt van belang voor relais 1, maar de uitgangen die op automatisch staan schakelen in volgorde eerst 1 dan 2 ...Om te vermijden dat een volgende ingang al schakelt alvorens een vorige zijn maximum op te nemen vermogen bereikt heeft deze vertraging. Byb een wasmachine begint niet onmiddellijk te verwarmen.

Tijd Als back-up voor slecht weer dagen kan je de uitgang ook op tijd laten schakelen. Je moet dan wel eerst de tijd instellen.

Als je niet wil dat een toestel op tijd start vul dan als uur 24 in.

De relais valt **NIET** automatisch af. Afzetten doe je door **A/M:0**

In het vak Tijd vul daar de tijd in 24 uurs formaat **uu:mm** en druk OK

Ver	bruik gegevens
Totaal electriciteit :	5930.162 KWh
Totaal injectie :	0.213 KWh
Verbruik nu :	0.158 KW
Injectie nu :	0.000 KW
Totaal gas :	2524.059 m3
	Tijd
	00:00
	ОК

Voor huishoudtoestellen geldt over het algemeen de regel dat die na een spanningsuitval hun programma verder zetten. Dit kunnen we gebruiken om de machines automatisch te starten.

Stuur uitgang van de relais dat het huishoudtoestel bedient via **A/M**: **1**. Zet het huishoudtoestel klaar en druk op start machine. Stuur na een korte tijd relais via **A/M**: **0** en dan **A/M**: **A**. Huishoudtoestel zal dan starten nadat de voorwaarden ingevuld in de verschillende vakjes voldaan zijn.

PWM uitgangsmodule

Onderdelen

1x ESP32WROOM Devkit

1x R 1K

1x BC547

1x 5V voeding

1x solid state relais welke kan gestuurd worden met 5V

https://nl.aliexpress.com/item/1005003457372056.html?

>> zie ook schema solid state relay aansluitingen hieronder

5V voeding >> 5V ESP32Devkit

>> zie ook schema solid state relay hieronder

ESP32 GPIO16 >> zie schema solid state relay hieronder

Om de PWM uitgangsmodule te kunnen gebruiken moeten we eerst het MAC adres van de hiervoor gebruikte ESP32 ESP32WROOM Devkit module kennen.

Open de Arduino IDE en open de monitor op 115200 baud.

Programmeer ESP32WROOM Devkit met het programma

MAC_adres_esp32.ino (bladzijde 38)

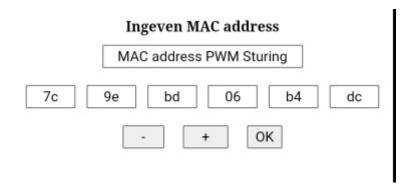

Het MAC adres verschijnt in de terminal.

Maak verbinding met de interface module.

Indien je gekozen hebt voor de _STA versie, doe je dit via je WiFi netwerk webadres 192.168.1.222 Indien je gekozen hebt voor de _AP versie via het ESP32 eigen netwerk.

Wifi netwerk ESP32Energie Paswoord ESP32pswd

webadres 192.168.4.1

Dit gedeelte van de webpagina heb je nu nodig. Met behulp van de + en – toetsen kan je kiezen welk MAC adres je wil ingeven. In dit geval dat van MAC address PWM sturing. Vul het adres in in de zes voorziene vakjes en druk OK.

Opgelet 2 dezelfde MAC adressen invullen voor verschillende modules gaat niet. Indien je het in te geven adres al hebt ingevuld voor een andere module verander dit eerst.

Heel belangrijk na het veranderen van *een(1)* MAC adres is er een automatische herstart van de interface module.

Laad het programma **esp32_pwm.ino** met behulp van de Arduino IDE in de ESP32WROOM Devkit module.

Om de PWM module te kunnen gebruiken hebben we dit gedeelte van de webpagina nodig.

		PW.	M sturi	ing	instelle	en	
KW:	1.50	1:	24:00	0:	00:00	A/M:	0
			(ЭК			

.

KW vul hier het vermogen in van bvb de elektrische boiler die met deze uitgang verbonden is. Dit om te weten hoeveel procent er kan uitgestuurd worden om het beschikbare vermogen te gebruiken.

Waarde op 0 laten resulteert in een AAN – UIT regeling. Beste is deze waarde zo juist mogelijk in te vullen.

Gebruik deze uitgang zeker niet bij toestellen met een motor / ventilator.

1: Als je ook tijd gestuurd wil schakelen, vul hier de inschakeltijd in. Indien niet gewenst vul dan als uur 24 in. Bij tijd sturing wordt de uitgang maximaal uitgestuurd.

0: uitschakeltijd.

A/M: A Vermogen naar uitgang wordt gestuurd in funktie van het beschikbare opgewekte vermogen.

Om tijdssturing te kunnen gebruiken moet dit veld eveneens op A staan.

- 0 Uitgang is uitgeschakeld
- 1 Uitgang is volledig uitgestuurd

Dat was het,

Live long and prosper (Vulcaans: Dif-tor heh smusma),
